Generalized finite integral involving the multiple logarithm-function, a general class of polynomials, the multivariable Aleph-function, the multivariable I-function I

F.Y. AYANT

1 Teacher in High School, France

ABSTRACT

In the present paper we evaluate a generalized finite integral involving the product of the multiple logarithm function, the multivariable Aleph-function, the multivariable I-function defined by Prasad and general class of polynomials of several variables. The importance of the result established in this paper lies in the fact they involve the Aleph-function of several variables which is sufficiently general in nature and capable to yielding a large of results merely by specialization the parameters their in.

Keywords: Multivariable Aleph-function, general class of polynomial, multiple logarithm function, multivariable I-function, multivariable H-function.

2010 Mathematics Subject Classification. 33C99, 33C60, 44A20

1. Introduction and preliminaries.

The function Aleph of several variables generalize the multivariable I-function recently study by C.K. Sharma and Ahmad [3], itself is an a generalisation of G and H-functions of multiple variables. The multiple Mellin-Barnes integral occurring in this paper will be referred to as the multivariable Aleph-function throughout our present study and will be defined and represented as follows.

We define:

\[ N(z_1, \ldots, z_r) = \int_{\mathbb{R}^r} \psi(s_1, \ldots, s_r) \prod_{k=1}^{r} \theta_k(s_k) y_k^{s_k} \, ds_1 \cdots ds_r \] (1.1)

with \( \omega = \sqrt{-1} \)

\[ \psi(s_1, \ldots, s_r) = \frac{\prod_{j=1}^{N} (1 - a_j + \sum_{k=1}^{r} \alpha_{j}^{(k)} s_k)}{\sum_{i=1}^{R} \prod_{j=N+1}^{P_i} (1 - b_{ji} + \sum_{k=1}^{r} \beta_{ji}^{(k)} s_k)} \] (1.2)

ISSN: 2231-5373  http://www.ijmttjournal.org  Page 6
Suppose, as usual, that the parameters 

\[ b_j, j = 1, \cdots, Q; a_j, j = 1, \cdots, P; \]

\[ c_j^{(k)}, j = n_k + 1, \cdots, P_{j(k)}; c_j^{(k)}, j = 1, \cdots, N_k; \]

\[ d_j^{(k)}, j = M_k + 1, \cdots, Q_{j(k)}; d_j^{(k)}, j = 1, \cdots, M_k; \]

with \( k = 1, \cdots, r, i = 1, \cdots, R, i(k) = 1, \cdots, R(k) \)

are complex numbers, and the \( \alpha's, \beta's, \gamma's \) and \( \delta's \) are assumed to be positive real numbers for standardization purpose such that

\[
U_i^{(k)} = \sum_{j=1}^{N_k} \alpha_j^{(k)} + \tau_i \sum_{j=N_k+1}^{P_k} \alpha_j^{(k)} + \sum_{j=1}^{N_k} \gamma_j^{(k)} + \tau_i \gamma_j^{(k)} - \sum_{j=1}^{Q_k} \beta_j^{(k)} - \sum_{j=1}^{M_k} \delta_j^{(k)} - \tau_i \sum_{j=M_k+1}^{Q_k} \delta_j^{(k)} \quad (1.4)
\]

The real numbers \( \tau_i \) are positives for \( i = 1 \) to \( R \), \( \tau_i^{(k)} \) are positives for \( i(k) = 1 \) to \( R(k) \)

The contour \( L_k \) is in the \( s_k\)-\( p \)-plane and run from \( \sigma - i \infty \) to \( \sigma + i \infty \) where \( \sigma \) is a real number with loop, if necessary, ensure that the poles of \( \Gamma'(d_j^{(k)} - \delta_j^{(k)} s_k) \) with \( j = 1 \) to \( m_k \) are separated from those of \( \Gamma(1 - a_j + \sum_{i=1}^{r} \alpha_j^{(k)} s_k) \) with \( j = 1 \) to \( N_k \) and \( \Gamma(1 - c_j^{(k)} + \gamma_j^{(k)} s_k) \) with \( j = 1 \) to \( N_k \) to the left of the contour \( L_k \). The condition for absolute convergence of multiple Mellin-Barnes type contour (1.9) can be obtained by extension of the corresponding conditions for multivariable H-function given by as:

\[ |\arg z_k| < \frac{1}{2} A_i^{(k)} \pi, \]

where

\[
A_i^{(k)} = \sum_{j=1}^{N_k} \alpha_j^{(k)} - \tau_i \sum_{j=N_k+1}^{P_k} \alpha_j^{(k)} - \tau_i \sum_{j=1}^{Q_k} \beta_j^{(k)} + \sum_{j=1}^{M_k} \gamma_j^{(k)} - \tau_i \sum_{j=M_k+1}^{Q_k} \delta_j^{(k)}
\]

\[ + \sum_{j=1}^{M_k} \delta_j^{(k)} - \tau_i \sum_{j=M_k+1}^{Q_k} \delta_j^{(k)} > 0, \quad \text{with} \quad k = 1, \cdots, r, i = 1, \cdots, R, i(k) = 1, \cdots, R(k) \quad (1.5)\]

The complex numbers \( z_i \) are not zero. Throughout this document, we assume the existence and absolute convergence conditions of the multivariable Aleph-function.

We may establish the asymptotic expansion in the following convenient form:

\[ N(z_1, \cdots, z_r) = 0(\max_{1 \leq i \leq r} |z_i|, \max_{1 \leq i \leq r} |z_i|) \to 0 \]

\[ N(z_1, \cdots, z_r) = 0\min_{1 \leq i \leq r} |z_i|, \max_{1 \leq i \leq r} |z_i|) \to \infty \]
where, with \( k = 1, \ldots, r : \alpha_k = \min \{ \text{Re}(a_j^{(k)}/\delta_j^{(k)}) \}, j = 1, \ldots, M_k \) and

\[
\beta_k = \max \{ \text{Re}((c_j^{(k)}/\gamma_j^{(k)})) \}, j = 1, \ldots, N_k
\]

Serie representation of Aleph-function of several variables is given by

\[
\mathcal{N}(y_1, \ldots, y_r) = \sum_{G_1, \ldots, G_r = 0}^{\infty} \prod_{g_i = 0}^{M_i} \prod_{g_r = 0}^{M_r} \frac{(-)^{G_1 + \cdots + G_r}}{G_1! \cdots G_r!} \psi(\eta_{G_1, g_1}, \ldots, \eta_{G_r, g_r}) \times \theta_1(\eta_{G_1, g_1}) \cdots \theta_r(\eta_{G_r, g_r}) y_1^{-\eta_{G_1, g_1}} \cdots y_r^{-\eta_{G_r, g_r}}
\]

(1.6)

Where \( \psi(\cdot, \ldots, \cdot), \theta_i(\cdot), i = 1, \ldots, r \) are given respectively in (1.2), (1.3) and

\[
\eta_{G_i, g_i} = \frac{d_{g_i}^{(i)} + G_i}{\delta_{g_i}^{(i)}}, \quad \eta_{G_r, g_r} = \frac{d_{g_r}^{(r)} + G_r}{\delta_{g_r}^{(r)}}
\]

which is valid under the conditions

\[
\delta_{g_i}^{(i)} [d_{j_i}^{(i)} + p_i] \neq \delta_{j_i}^{(i)} [d_{g_i}^{(i)} + G_i]
\]

(1.7)

for \( j \neq M_i, M_i = 1, \ldots, n_{G_i, g_i}; P_i, N_i = 0, 1, 2, \ldots, y_i \neq 0, i = 1, \ldots, r \)

In the document, we will note:

\[
G(\eta_{G_1, g_1}, \ldots, \eta_{G_r, g_r}) = \phi(\eta_{G_1, g_1}, \ldots, \eta_{G_r, g_r}) \theta_1(\eta_{G_1, g_1}) \cdots \theta_r(\eta_{G_r, g_r})
\]

(1.9)

where \( \phi(\eta_{G_1, g_1}, \ldots, \eta_{G_r, g_r}), \theta_1(\eta_{G_1, g_1}), \ldots, \theta_r(\eta_{G_r, g_r}) \) are given respectively in (1.2) and (1.3)

We will note the Aleph-function of \( r \) variables

\[
\mathcal{N}_{w, w}^{0, N, \nu} \left( \begin{array}{c}
z_1 \\
\vdots \\
z_r
\end{array} \right)
\]

(1.10)

The multivariable I-function is defined in term of multiple Mellin-Barnes type integral:

\[
I(z_1, z_2, \ldots, z_s) = \prod_{p_2, q_2, \ldots, p_s, q_s} \left( \begin{array}{cccc}
z_1 & \cdots & \alpha_{2j} & \alpha_{2j}^\prime & \alpha_{2j}^\prime & \beta_{2j} & \beta_{2j}^\prime \\
\cdot & \cdot & \cdot & \cdot & \cdot & \cdot & \cdot \\
& & (a_{2j}, a_{2j}^\prime, a_{2j}^\prime)_{1, p_2} & \cdots \\
& & (b_{2j}, b_{2j}^\prime, b_{2j}^\prime)_{1, q_2} & \cdots \\
& & (a_{s2j}, \alpha_{s2j}^s, \alpha_{s2j}^s)_{1, p_s} & \cdots \\
& & (b_{s2j}, \beta_{s2j}^s, \beta_{s2j}^s)_{1, q_s} & \cdots \\
& & \cdots & \cdots \\
& & \cdots & \cdots \\
& & \cdots & \cdots
\end{array} \right)
\]

(1.11)
The defined integral of the above function, the existence and convergence conditions, see Y, N Prasad [2]. Throughout the present document, we assume that the existence and convergence conditions of the multivariable I-function.

The condition for absolute convergence of multiple Mellin-Barnes type contour (1.9) can be obtained by extension of the corresponding conditions for multivariable H-function given by as:

\[ |\text{arg} z_k| < \frac{1}{2} \Omega_i^{(k)} \pi, \]

where

\[ \Omega_i^{(k)} = \sum_{k=1}^{n^1} \alpha_k^{(i)} - \sum_{k=n^1+1}^{p^1} \alpha_k^{(i)} + \sum_{k=1}^{m^1} \beta_k^{(i)} - \sum_{k=m^1+1}^{q^1} \beta_k^{(i)} + \left( \sum_{k=1}^{n_2} \alpha_{2k}^{(i)} - \sum_{k=n_2+1}^{p_2} \alpha_{2k}^{(i)} \right) + \cdots \]

\[ \left( \sum_{k=1}^{n_s} \alpha_{sk}^{(i)} - \sum_{k=n_s+1}^{p_s} \alpha_{sk}^{(i)} \right) - \left( \sum_{k=1}^{q_{2k}} \beta_{3k}^{(i)} + \sum_{k=1}^{q_{3k}} \beta_{4k}^{(i)} + \cdots + \sum_{k=1}^{q_{sk}} \beta_{sk}^{(i)} \right) \]  

(1.13)

where \( i = 1, \ldots, s \)

The complex numbers \( z_i \) are not zero. Throughout this document, we assume the existence and absolute convergence conditions of the multivariable I-function.

We may establish the asymptotic expansion in the following convenient form:

\[ I(z_1, \ldots, z_s) = 0( |z_1|^{\alpha_1}, \ldots, |z_s|^{\alpha_s}), \max(|z_1|, \ldots, |z_s|) \to 0 \]

\[ I(z_1, \ldots, z_s) = 0( |z_1|^{\beta_1}, \ldots, |z_s|^{\beta_s}), \min(|z_1|, \ldots, |z_s|) \to \infty \]

where, with \( k = 1, \ldots, z : \alpha_k^{(j)} = \min\{\text{Re}(b_j^{(k)}/\beta_j^{(k)})|, j = 1, \ldots, m_k \) and

\[ \beta_k^{(j)} = \max\{\text{Re}(\alpha_j^{(k)} - 1)/\alpha_j^{(k)}|, j = 1, \ldots, n_k \]

We will use these following notations in this paper:

\[ U = p_2, q_2, p_3, q_3; \ldots; p_{s-1}, q_{s-1}; V = 0, n_2; 0, n_3; \ldots; 0, n_{s-1} \]  

(1.14)

\[ W = (p', q'); \ldots; (p^{(s)}, q^{(s)}); X = (m', n'); \ldots; (m^{(s)}, n^{(s)}) \]  

(1.15)

\[ A = (a_2k, \alpha_2k', \alpha_2k''); \ldots; (a_{(s-1)k}, \alpha_{(s-1)k}', \alpha_{(s-1)k}''); \alpha_{(s-1)k}) \]  

(1.16)

\[ B = (b_2k, \beta_2k', \beta_2k''); \ldots; (b_{(s-1)k}, \beta_{(s-1)k}', \beta_{(s-1)k}''); \beta_{(s-1)k}) \]  

(1.17)

\[ A = (a_{sk}, \alpha_{sk}', \alpha_{sk}''); \ldots; \alpha_{sk} ; B = (b_{sk}, \beta_{sk}', \beta_{sk}''); \beta_{sk} \]  

(1.18)
\[ A' = (a_k', \alpha_k')_{1,p', \cdots}; (a_k^{(s)}, \alpha_k^{(s)})_{1,p,s}; B' = (b_k', \beta_k')_{1,q', \cdots}; (b_k^{(s)}, \beta_k^{(s)})_{1,q,s} \]  

(1.19)

The multivariable I-function write:

\[ I(z_1, \cdots, z_s) = I_{U; p, q, W}^{V; 0, n, \chi} \begin{pmatrix} z_1 & \vdots & A' ; \mathfrak{A}' \\ \vdots & \ddots & \vdots \\ z_s & \vdots & B' ; \mathfrak{B}' ; B' \end{pmatrix} \]  

(1.20)

The generalized polynomials defined by Srivastava [4], is given in the following manner:

\[ S^M_1, \cdots, M_t [y_1, \cdots, y_t] = \sum_{K_1=0}^{[N'_1/M'_1]} \cdots \sum_{K_t=0}^{[N'_t/M'_t]} \frac{(-N'_1)M'_1K_1}{K'_1!} \cdots \frac{(-N'_t)M'_tK_t}{K'_t!} A[N'_1, K_1; \cdots; N'_t, K_t]y_1^{K_1} \cdots y_t^{K_t} \]  

(1.21)

Where \( M'_1, \cdots, M'_t \) are arbitrary positive integers and the coefficients \( A[N'_1, K_1; \cdots; N'_t, K_t] \) are arbitrary constants, real or complex. In the present paper, we use the following notation:

\[ a_1 = \frac{(-N'_1)M'_1K_1}{K'_1!} \cdots \frac{(-N'_t)M'_tK_t}{K'_t!} A[N'_1, K_1; \cdots; N'_t, K_t] \]  

(1.22)

2. Multiple logarithm function

The multiple logarithm function denoted \( \text{Li}_{k_1, k_2, \cdots, k_n}(z) \) is defined by the following multiple sum, see Taekyum K. et al [7].

\[ \text{Li}_{k_1, k_2, \cdots, k_n}(z) = \sum_{m_1 < m_2 < \cdots < m_n} \frac{z^{m_n}}{m_1^{k_1} \cdots m_n^{k_n}} \]  

(2.1)

with the validity conditions: \( k_i \geq 1 (i = 1, \cdots, n), |z| < 1 \)

3. Required integral

We have the following result, see Brychkow ([1], 4.1.5, eq.135 page 149)

\[ \int_0^1 \frac{x^{\mu-1}}{\sqrt{1 + b^2x^2}} \ln(b\sqrt{x} + \sqrt{1 + b^2x}) \ln \left( \frac{a + \sqrt{a^2 - x^2}}{x} \right) \, dx = \frac{\sqrt{\pi}a^{\mu+1}b\Gamma \left( \frac{\mu+1}{2} \right)}{2(\mu + 1)\Gamma \left( \frac{\mu}{2} + 1 \right)} \]

\[ \times \begin{pmatrix} 1, 1, \frac{\mu+1}{2}, \frac{\mu+1}{2} \\ \cdots \\ \frac{3}{2}, 1 + \frac{\mu}{2}, \frac{\mu+3}{2} \end{pmatrix} ; -a^2 b^2 \]  

(3.1)
with $a > 0$, $\Re(\mu) < -1$, $|\arg(1 + a^2 b^2)| < \pi$

4. Main integral

We have the following finite integral:

$$\int_0^1 \frac{x^{\mu-1}}{\sqrt{1 + b^2 x^2}} \ln(b \sqrt{x} + \sqrt{1 + b^2 x}) \ln \left( \frac{a + \sqrt{a^2 - x^2}}{x} \right) L_i k_1, k_2, \ldots, k_n (z x^\alpha)$$

$$S_{M_1, \ldots, M_t}^{M'_1, \ldots, M'_t} \left( \begin{array}{c} y_1 x^{\gamma_1} \\ \vdots \\ y_t x^{\gamma_t} \end{array} \right)_{N_0, N_v} \left( \begin{array}{c} z_1 x^{\alpha_1} \\ \vdots \\ z_t x^{\alpha_t} \end{array} \right)_{I_{U': p, q': W}} \left( \begin{array}{c} Z_1 x^{\eta_1} \\ \vdots \\ Z_t x^{\eta_t} \end{array} \right) \right) \left( \begin{array}{c} \frac{\sqrt{\pi} a^{\mu+1} b}{2} \\ \vdots \\ \delta g_{\gamma_1} \Delta_{g_{\eta_1}} G_{\gamma_1, \theta_1, \ldots, \theta_t} \left( \begin{array}{c} G_{\eta_1, \gamma_1, \ldots, \eta_t, \theta_t} \end{array} \right) \left( \begin{array}{c} -1 \end{array} \right) G_{\gamma_1, \theta_1, \ldots, \theta_t} \right)$$

$$\frac{a_1^{n'1}(-a^2 b^2)^{n'}}{\sqrt{2}} z_1^{\eta_{\gamma_1, \gamma_1}} \ldots z_t^{\eta_{\gamma_t, \gamma_t}} y_1^{K_1} \ldots y_t^{K_t} z_1 m_n a^{m_n \alpha + \sum_{i=1}^t K_i \gamma_i + \sum_{i=1}^n \eta_{\gamma_i, \gamma_i, \alpha_i}}$$

$$\begin{pmatrix} \Lambda : (\frac{1}{2} - n' - \frac{1}{2}) (\mu + m_n \alpha + \sum_{i=1}^t K_i \gamma_i + \sum_{i=1}^n \eta_{\gamma_i, \gamma_i, \alpha_i}); \frac{\eta_1}{2}, \ldots, \frac{\eta_t}{2} \end{pmatrix},$$

$$\begin{pmatrix} B : (-n' - \frac{1}{2}) (\mu + m_n \alpha + \sum_{i=1}^t K_i \gamma_i + \sum_{i=1}^n \eta_{\gamma_i, \gamma_i, \alpha_i}); \frac{\eta_1}{2}, \ldots, \frac{\eta_t}{2} \end{pmatrix},$$

$$\begin{pmatrix} (\frac{1}{2} - n' - \frac{1}{2}) (\mu + m_n \alpha + \sum_{i=1}^t K_i \gamma_i + \sum_{i=1}^n \eta_{\gamma_i, \gamma_i, \alpha_i}); \frac{\eta_1}{2}, \ldots, \frac{\eta_t}{2} \end{pmatrix},$$

$$\begin{pmatrix} (\frac{1}{2} - \frac{1}{2}) (\mu + m_n \alpha + \sum_{i=1}^t K_i \gamma_i + \sum_{i=1}^n \eta_{\gamma_i, \gamma_i, \alpha_i}); \frac{\eta_1}{2}, \ldots, \frac{\eta_t}{2} \end{pmatrix},$$

$$\begin{pmatrix} -(\mu + m_n \alpha + \sum_{i=1}^t K_i \gamma_i + \sum_{i=1}^n \eta_{\gamma_i, \gamma_i, \alpha_i}); \eta_1, \ldots, \eta_t \end{pmatrix},$$

$$\begin{pmatrix} -1(\mu + m_n \alpha + \sum_{i=1}^t K_i \gamma_i + \sum_{i=1}^n \eta_{\gamma_i, \gamma_i, \alpha_i}); \eta_1, \ldots, \eta_t \end{pmatrix}.$$
Provided that

\begin{align*}
&\text{a) } \min\{\alpha, \gamma_i, \alpha_j, \eta_k\} > 0, \ i = 1, \ldots, t, \ j = 1, \ldots, r, \ k = 1, \ldots, s \\
&\text{b) } \Re \mu + m_n \alpha + \sum_{i=1}^{r} \alpha_i \min_{1 \leq j \leq M_i} \frac{d_j^{(i)}}{\beta_j^{(i)}} + \sum_{i=1}^{s} \eta_i \min_{1 \leq j \leq m(i)} \frac{b_j^{(i)}}{\beta_j^{(i)}} > -1 \\
&\text{c) } |\arg z_k| < \frac{1}{2} A_i^{(k)} \pi, \text{ where } A_i^{(k)} \text{ is defined by (1.5)} ; \ i = 1, \ldots, r \\
&\text{d) } |\arg Z_k| < \frac{1}{2} \Omega_i^{(k)} \pi, \text{ where } \Omega_i^{(k)} \text{ is defined by (1.11)} ; \ i = 1, \ldots, s \\
&\text{e) The multiple serie occuring on the right-hand side of (3.1) is absolutely and uniformly convergent.} \\
&\text{f) } \alpha > 0, |\arg(1 + a^2 b^2)| < \pi
\end{align*}

First, expressing the extension of the multiple logarithm function \(Li_{k_1, k_2, \ldots, k_n}(z)\) in serie with the help of equation (2.1), the Aleph-function of \(r\) variables in series with the help of equation (1.6), the general class of polynomial of several variables \(S_{N_1, \ldots, N_t}^{M_1, \ldots, M_t}[y_1, \ldots, y_t]\) with the help of equation (1.19) and the Prasad's multivariable I-function of \(s\) variables in Mellin-Barnes contour integral with the help of equation (1.10), changing the order of integration ans summation (which is easily seen to be justified due to the absolute convergence of the integral and the summations involved in the process) and then evaluating the resulting integral with the help of equation (3.1) and expressing the generalized hypergeometric function \(F_3\) in serie, use several times, the following relations \(\Gamma(a)(a)_n = \Gamma(a + n)\) and \(a = \frac{\Gamma(a + 1)}{\Gamma(a)}\) with \(\Re(a) > 0\). Finally interpreting the result thus obtained with the Mellin-Barnes contour integral, we arrive at the desired result.

The quantities \(U, V, W, X, A, B, \mathfrak{A}, \mathfrak{B}, A'\) and \(B'\) are defined by the equations (1.14) to (1.19)

5. Particular case

If \(U = V = A = B = 0\), the multivariable I-function defined by Prasad degenerates in multivariable H-function defined by Srivastava et al [5]. We have the following result.

\[
\int_0^1 \frac{x^{\mu-1}}{1 + b^2 x^2} \ln(b \sqrt{x} + \sqrt{1 + b^2 x}) \ln \left( \frac{a + \sqrt{a^2 - x^2}}{x} \right) Li_{k_1, k_2, \ldots, k_n}(z x^\alpha) dx = \frac{\sqrt{\pi} a^{\mu+1} b}{2}
\]

\[
S_{N_1, \ldots, N_t}^{M_1, \ldots, M_t} \begin{pmatrix} y_1 x^{\gamma_1} \\ \vdots \\ y_t x^{\gamma_t} \end{pmatrix} H_{u_0, N_i}^{0, N_i; v_i} x^{\alpha_i} H_{p_s, q_s; v}^{0, n_i; X} x^{\alpha_r} dx = \frac{\sqrt{\pi} a^{\mu+1} b}{2}
\]
under the same notations and conditions that (4.1) with \( U = V = A = B = 0 \)

6. Conclusion

In this paper we have evaluated a generalized finite integral involving the multivariable Aleph-function, a class of polynomials of several variables a extension of the multiple logarithm function and the multivariable I-function defined by Prasad. The integral established in this paper is of very general nature as it contains Multivariable Aleph-function, which is a general function of several variables studied so far. Thus, the integral established in this research work would serve as a key formula from which, upon specializing the parameters, as many as desired results involving the special functions of one and several variables can be obtained.
