infinite integral involving a general sequence of functions, a class of polynomials and multivariable Aleph-functions II

F.Y. AYANT

1 Teacher in High School, France

ABSTRACT

In the present paper we evaluate an infinite integral with three parameters involving the product of a general sequence of functions, multivariable Aleph-functions and general class of polynomials of several variables. The importance of the result established in this paper lies in the fact they involve the Aleph-function of several variables which is sufficiently general in nature and capable to yielding a large of results merely by specializing the parameters in.

Keywords: Multivariable Aleph-function, general class of polynomials, General sequence of functions

2010 Mathematics Subject Classification. 33C99, 33C60, 44A20

1. Introduction and preliminaries.

The function Aleph of several variables generalize the multivariable I-function recently study by C.K. Sharma and Ahmad [6], itself is an a generalisation of G and H-functions of multiple variables. The multiple Mellin-Barnes integral occurring in this paper will be referred to as the multivariable Aleph-function throughout our present study and will be defined and represented as follows.

We define:

\[ \mathcal{N}(z_1, \cdots, z_r) = \mathcal{N}^{0,n;m_1,n_1, \cdots, m_r,n_r}_{p_1,q_1,\tau_1;R;\tau_{1(i)};R^{(1)}}; \cdots; p_{(r)},q_{(r)},\tau_{(r)};R^{(r)} \left( \begin{array}{c} z_1 \\ \vdots \\ z_r \end{array} \right) \]

\[ \left[ (\alpha_j^{(1)}; \cdots, \alpha_j^{(r)})_{1,n} \right] \left[ (\sigma_j^{(1)}; \cdots, \sigma_j^{(r)})_{n+1,p} \right] \]

\[ \left[ \left[ (\zeta_j^{(1)}; \cdots, \zeta_j^{(r)})_{1,n+1+q} \right] \vdots \right) \left[ \left[ (\zeta_j^{(r)}; \cdots, \zeta_j^{(r)})_{n+1+p} \right] \right. \left. \right] \]

\[ \left[ (\zeta_j^{(1)}; \cdots, \zeta_j^{(r)})_{1,n+1+q} \right] \left[ (\zeta_j^{(r)}; \cdots, \zeta_j^{(r)})_{n+1+p} \right] \]

\[ \frac{1}{(2\pi \omega)^r} \int_{L_1} \cdots \int_{L_r} \psi(s_1, \cdots, s_r) \prod_{k=1}^{r} \theta_k(s_k) y_k^{s_k} \, ds_1 \cdots ds_r \quad (1.1) \]

with \( \omega = \sqrt{-1} \)

\[ \psi(s_1, \cdots, s_r) = \frac{\prod_{i=1}^{n} \Gamma(1 - \alpha_j + \sum_{k=1}^{r} \alpha_j^{(k)} s_k) \prod_{i=1}^{m} \Gamma(1 - b_j + \sum_{k=1}^{r} \beta_j^{(k)} s_k)}{\prod_{i=1}^{n} \Gamma(1 - \alpha_j + \sum_{k=1}^{r} \alpha_j^{(k)} s_k) \prod_{i=1}^{m} \Gamma(1 - b_j + \sum_{k=1}^{r} \beta_j^{(k)} s_k)} \quad (1.2) \]

and \( \theta_k(s_k) = \frac{\prod_{i=1}^{m} \Gamma(1 - \alpha_j^{(k)} s_k) \prod_{i=1}^{n} \Gamma(1 - \tau_j + \gamma_j^{(k)} s_k)}{\prod_{i=1}^{m} \Gamma(1 - \alpha_j^{(k)} s_k) \prod_{i=1}^{n} \Gamma(1 - \tau_j + \gamma_j^{(k)} s_k)} \quad (1.3) \)
Suppose, as usual, that the parameters

\[ a_j, j = 1, \ldots, p; b_j, j = 1, \ldots, q; \]

\[ c_{j}^{(k)}, j = 1, \ldots, n_k; c_{j}^{(k)}; j = n_k + 1, \ldots, p; \]

\[ d_{j}^{(k)}, j = 1, \ldots, m_k; d_{j}^{(k)}; j = m_k + 1, \ldots, q; \]

with \( k = 1, \ldots, r, i = 1, \ldots, R, i^{(k)} = 1, \ldots, R^{(k)} \)

are complex numbers, and the \( \alpha^\prime s, \beta^\prime s, \gamma^\prime s \) and \( \delta^\prime s \) are assumed to be positive real numbers for standardization purpose such that

\[
U_{i}^{(k)} = \sum_{j=1}^{n} \alpha_{j}^{(k)} + \tau_{i} \sum_{j=1}^{n} \alpha_{j}^{(k)} + \sum_{j=1}^{n_k} \gamma_{j}^{(k)} + \tau_{i} \sum_{j=n_k+1}^{p} \gamma_{j}^{(k)} + \tau_{i} \sum_{j=1}^{n_k} \beta_{j}^{(k)} + \sum_{j=1}^{m_k} \delta_{j}^{(k)} + \sum_{j=m_k+1}^{q} \delta_{j}^{(k)} - \tau_{i} \sum_{j=n_k+1}^{p} \delta_{j}^{(k)} - \sum_{j=1}^{m_k} \delta_{j}^{(k)} \leqslant 0
\]

(1.4)

The real numbers \( \tau_{i} \) are positives for \( i = 1 \) to \( R, \tau_{i}^{(k)} \) are positives for \( i^{(k)} = 1 \) to \( R^{(k)} \)

The contour \( L_{k} \) is in the \( s_k\)-plane and range from \( \sigma - \infty \) to \( \sigma + \infty \) where \( \sigma \) is a real number with loop, if necessary, ensure that the poles of \( \Gamma(d_{j}^{(k)} - \delta_{j}^{(k)} s_k) \) with \( j = 1 \) to \( m_k \) are separated from those of \( \Gamma(1 - a_j + \sum_{i=1}^{r} c_{j}^{(k)} s_k) \) with \( j = 1 \) to \( n \) and \( \Gamma(1 - c_{j}^{(k)} + \gamma_j^{(k)} s_k) \) with \( j = 1 \) to \( n_k \) to the left of the contour \( L_k \). The condition for absolute convergence of multiple Mellin-Barnes type contour (1.9) can be obtained by extension of the corresponding conditions for multivariable H-function given by as:

\[ |\arg z_k| < \frac{1}{2} A_i^{(k)} \pi, \text{ where} \]

\[
A_i^{(k)} = \sum_{j=1}^{n} \alpha_{j}^{(k)} - \tau_{i} \sum_{j=n+1}^{p} \alpha_{j}^{(k)} - \tau_{i} \sum_{j=1}^{n_k} \beta_{j}^{(k)} + \sum_{j=1}^{n_k} \gamma_{j}^{(k)} - \tau_{i} \sum_{j=n_k+1}^{p} \gamma_{j}^{(k)} + \sum_{j=1}^{m_k} \delta_{j}^{(k)} - \sum_{j=m_k+1}^{q} \delta_{j}^{(k)} > 0, \text{ with } k = 1 \cdots, r, i = 1, \cdots, R, i^{(k)} = 1, \cdots, R^{(k)} \]

(1.5)

The complex numbers \( z_k \) are not zero. Throughout this document, we assume the existence and absolute convergence conditions of the multivariable Aleph-function.

We may establish the asymptotic expansion in the following convenient form:

\[ \Re(z_1, \cdots, z_r) = 0(\ |z_1|^\alpha_1, \cdots, |z_r|^\alpha_r) \text{, max}(\ |z_1|, \cdots, |z_r|) \rightarrow 0 \]

\[ \Re(z_1, \cdots, z_r) = 0(\ |z_1|^\beta_1, \cdots, |z_r|^\beta_r) \text{, min}(\ |z_1|, \cdots, |z_r|) \rightarrow \infty \]

where, with \( k = 1, \cdots, r : \alpha_k = \min(\Re(d_{j}^{(k)}/\delta_{j}^{(k)})], j = 1, \cdots, m_k \)

\[ \beta_k = \max(\Re((c_{j}^{(k)} - 1)/\gamma_j^{(k)}], j = 1, \cdots, n_k \]
Serie representation of Aleph-function of several variables is given by

\[ N(y_1, \ldots, y_r) = \sum_{G_1, \ldots, G_r = 0}^{\infty} \sum_{g_1 = 0}^{m_1} \ldots \sum_{g_r = 0}^{m_r} \frac{(-G_1 + \cdots + G_r)}{G_1! \cdots G_r!} \psi(\eta G_{i, g_i}, \ldots, \eta G_{r, g_r}) \]

\[ \times \theta_1(\eta G_{1, g_1}) \cdots \theta_r(\eta G_{r, g_r}) y_1^{-\eta G_{1, g_1}} \cdots y_r^{-\eta G_{r, g_r}} \]  
(1.6)

Where \( \psi(\ldots, \ldots, \cdot) \), \( \theta_i(\cdot) \), \( i = 1, \ldots, r \) are given respectively in (1.2), (1.3) and

\[ \eta G_{i, g_i} = \frac{d_g(1) + G_i}{d_g(1)}, \ldots, \eta G_{r, g_r} = \frac{d_g(r) + G_r}{d_g(r)} \]

which is valid under the conditions

\[ \delta_g^{(i)}[d_g^i + p_i] \neq \delta_g^{(j)}[d_g^j + G_i] \]  
(1.7)

for \( j \neq m_i, m_i = 1, \ldots, \eta G_{i, g_i}; p_i, n_i = 0, 1, 2, \ldots, y_i \neq 0, i = 1, \ldots, r \)  
(1.8)

Consider the Aleph-function of \( s \) variables

\[ N(z_1, \ldots, z_s) = \sum_{P_1, Q_1, \ldots, P_s, Q_s, \ldots} \left( \begin{array}{c} z_1 \\ \vdots \\ z_s \end{array} \right) \left[ \begin{array}{c} \mu_{1}^{(1)}(z_1, \ldots, z_s) \\ \vdots \\ \mu_{s}^{(s)}(z_1, \ldots, z_s) \end{array} \right] \]

\[ \left( \begin{array}{c} \alpha_{1}^{(1)}(1, N_1) \\ \vdots \\ \alpha_{s}^{(s)}(1, N_s) \end{array} \right) \]  
(1.9)

Suppose, as usual, that the parameters

\[ u_j, j = 1, \ldots, P; v_j, j = 1, \ldots, Q; \]

ISSN: 2231-5373  http://www.ijmmtjournal.org  Page 154
\( a_j^{(k)}, j = 1, \cdots, N_k; a_{j_1}^{(k)}, j = n_k + 1, \cdots, P_i^{(k)}; \)

\( b_j^{(k)}, j = m_k + 1, \cdots, Q_i^{(k)}; b_j^{(k)}, j = 1, \cdots, M_k; \)

with \( k = 1, \cdots, s, i = 1, \cdots, r', i^{(k)} = 1, \cdots, r^{(k)} \)

are complex numbers, and the \( \alpha^s, \beta^s, \gamma^s \) and \( \delta^s \) are assumed to be positive real numbers for standardization purpose such that

\[
U_i^{(k)} = \sum_{j=1}^{N} \mu_j^{(k)} + \nu_i \sum_{j=N+1}^{P} \mu_j^{(k)} + \sum_{j=1}^{N_k} \alpha_j^{(k)} + \nu_i \sum_{j=N_k+1}^{P_i^{(k)}} \alpha_j^{(k)} - \nu_i \sum_{j=1}^{Q_i^{(k)}} \nu_j^{(k)} - \sum_{j=1}^{M_k} \beta_j^{(k)} - \nu_i \sum_{j=M_k+1}^{Q_i^{(k)}} \beta_j^{(k)} \leq 0 \quad (1.12)
\]

The reals numbers \( \tau_i \) are positives for \( i = 1, \cdots, r', \nu_i \) are positives for \( i^{(k)} = 1, \cdots, r^{(k)} \)

The contour \( L_k \) is in the \( t_k,p \) lane and run from \( \sigma - i\infty \) to \( \sigma + i\infty \) where \( \sigma \) is a real number with loop, if necessary, ensure that the poles of \( \Gamma(b_j^{(k)} - \beta_j^{(k)} t_k) \) with \( j = 1 \) to \( M_k \) are separated from those of \( \Gamma(1 - u_j + \sum_{j=1}^{s} b_j^{(k)} t_k) \) with \( j = 1 \) to \( N \) and \( \Gamma(1 - a_j^{(k)} + \alpha_j^{(k)} t_k) \) with \( j = 1 \) to \( N_k \) to the left of the contour \( L_k \). The condition for absolute convergence of multiple Mellin-Barnes type contour (1.9) can be obtained by extension of the corresponding conditions for multivariable H-function given by as:

\[
|\arg z_k| < \frac{1}{2} B_i^{(k)} \pi, \quad \text{where}
\]

\[
B_i^{(k)} = \sum_{j=1}^{N} \mu_j^{(k)} - \nu_i \sum_{j=N+1}^{P} \mu_j^{(k)} + \sum_{j=1}^{N_k} \alpha_j^{(k)} - \nu_i \sum_{j=N_k+1}^{P_i^{(k)}} \alpha_j^{(k)} + \sum_{j=1}^{M_k} \beta_j^{(k)} - \nu_i \sum_{j=M_k+1}^{Q_i^{(k)}} \beta_j^{(k)} > 0, \quad \text{with } k = 1, \cdots, s, i = 1, \cdots, r', i^{(k)} = 1, \cdots, r^{(k)} \quad (1.13)
\]

The complex numbers \( z_i \) are not zero. Throughout this document, we assume the existence and absolute convergence conditions of the multivariable Aleph-function.

We may establish the the asymptotic expansion in the following convenient form:

\( \mathcal{N}(z_1, \cdots, z_s) = 0( |z_1|^{\alpha^{s}}, \cdots, |z_s|^{\alpha^{s}} ) , \max( |z_1|, \cdots, |z_s| ) \to 0 \)

\( \mathcal{N}(z_1, \cdots, z_s) = 0( |z_1|^{\beta^{s}}, \cdots, |z_s|^{\beta^{s}} ) , \min( |z_1|, \cdots, |z_s| ) \to \infty \)

where, \( k = 1, \cdots, z : \alpha_k = \min[\text{Re}(b_j^{(k)}/\beta_j^{(k)})], j = 1, \cdots, M_k \) and \( \beta_k = \max[\text{Re}((\alpha_j^{(k)} - 1)/\alpha_j^{(k)})], j = 1, \cdots, N_k \)

We will use these following notations in this paper

\( U = P_i, Q_i, \nu_i; r' \); \( V = M_1, N_1; \cdots; M_s, N_s \quad (1.15) \)

ISSN: 2231-5373 \hspace{1cm} http://www.ijmttpjournal.org
The multivariable Aleph-function write:

\[ w = P_{i(1)}, Q_{i(1)}, r_{i(1)}, \ldots, P_{i(r)}, Q_{i(r)}, \ell_{i(s)} r^{(s)} \]  \hspace{1cm} (1.16)

\[ A = \{ (u_j, \mu_j^{(1)}, \ldots, \mu_j^{(s)}), (\ell_j, \mu_j^{(1)}, \ldots, \mu_j^{(s)}), N+1, P_i \} \]  \hspace{1cm} (1.17)

\[ B = \{ \ell_i(v_j; u_j^{(1)}, \ldots, v_j^{(s)}); M+1, Q_i \} \]  \hspace{1cm} (1.18)

\[ C = (a^{(1)}_{j, 1}, \alpha_j^{(1)})_{1, N_1}, (a^{(1)}_{j, 1}, \alpha_j^{(1)})_{N_1+1, P_i} \ldots, (a^{(s)}_{j, 1}, \alpha_j^{(s)})_{1, N_s}, (\ell_i, \alpha_j^{(s)})_{N_s+1, P_i} \]  \hspace{1cm} (1.19)

\[ D = (b^{(1)}_{j, 1}, \beta_j^{(1)})_{1, M_1}, (b^{(1)}_{j, 1}, \beta_j^{(1)})_{M_1+1, Q_i} \ldots, (b^{(s)}_{j, 1}, \beta_j^{(s)})_{1, M_s}, (\ell_i, \beta_j^{(s)})_{M_s+1, Q_i} \]  \hspace{1cm} (1.20)

The generalized polynomials defined by Srivastava [9], is given in the following manner:

\[ \mathcal{N}(z_1, \ldots, z_s) = \mathcal{N}_{U;W}^{0, N; V} \left( \begin{array}{c|cc}
  z_1 & A : C \\
  \vdots & \ddots & \hdots
  \\
  z_s & B : D
\end{array} \right) \]  \hspace{1cm} (1.21)

The generalized polynomials defined by Srivastava [9], is given in the following manner:

\[ S_{N_1, \ldots, N_t}^{M_1, \ldots, M_t} [y_1, \ldots, y_t] = \sum_{K_1 = 0}^{[N_1/M_1]} \ldots \sum_{K_t = 0}^{[N_t/M_t]} (-N_1)_{M_1 K_1} \ldots (-N_t)_{M_t K_t} K_1! \ldots K_t! \]  \hspace{1cm} (1.22)

Where \( M_1, \ldots, M_s \) are arbitrary positive integers and the coefficients \( A[N_1, K_1; \ldots; N_t, K_t] \) are arbitrary constants, real or complex. In the present paper, we use the following notation

\[ a_1 = \frac{(-N_1)_{M_1 K_1} \ldots (-N_t)_{M_t K_t} K_1! \ldots K_t!}{A[N_1, K_1; \ldots; N_t, K_t]} \]  \hspace{1cm} (1.23)

In the document, we note:

\[ G(\eta G_{1, \eta_1}, \ldots, \eta G_{r, \eta_r}) = \phi(\eta G_{1, \eta_1}, \ldots, \eta G_{r, \eta_r}), \theta_1(\eta G_{1, \eta_1}) \cdots \theta_r(\eta G_{r, \eta_r}) \]  \hspace{1cm} (1.24)

where \( \phi(\eta G_{1, \eta_1}, \ldots, \eta G_{r, \eta_r}), \theta_1(\eta G_{1, \eta_1}), \ldots, \theta_r(\eta G_{r, \eta_r}) \) are given respectively in (1.2) and (1.3)

2. Sequence of function

Agarwal and Chaubey [1], Salim [5] and several others have studied a general sequence of functions. In the present document we shall study the following useful series formula for a general sequence of functions.

\[ R^{a, b}_{n, d}[x; E, F, g; p, g; \gamma; \delta; e^{-x \sigma}] = \sum_{w, v, u, t, e, k_1, k_2} \psi(w, v, u, t, e, k_1, k_2) x^R \]  \hspace{1cm} (2.1)

where

\[ \sum_{w, v, u, t, e, k_1, k_2} = \sum_{w=0}^{\infty} \sum_{v=0}^{\infty} \sum_{u=0}^{\infty} \sum_{t=0}^{\infty} \sum_{\ell=0}^{\infty} \sum_{k_1=0}^{\infty} \sum_{k_2=0}^{\infty} \]  \hspace{1cm} (2.2)
and the infinite series on the right side (2.1) is absolutely convergent, 
\[ R = ln + qv + pt + rw + k1r + k2q \]
and
\[ \psi(w, v, u, t, e, k1, k2) = (-)^{t+w+k2}(-v)_{t+e}^{-e}(\alpha)_t^e t^n \] \[ s^{w+k1}l^{\gamma n-t} \] \[ (1 - \alpha - t)_e^{\alpha - \gamma n} \] \[ g^{v+k2}l^{\delta n-v-k2}(v - \delta n)_{k2} B^t \left( \frac{pe + rw + \lambda + qn}{l} \right) \]

where \( K_n \) is a sequence of constants.

By suitably specializing the parameters involving in (2.1), a general sequence of function reduced to generalized polynomials set studied by Raizada [4], a class of polynomials introduced by Fujiwara [2] and several others authors.

3. Required integral

We have the following result, see Saxena et al. (\[3\], page 72, Eq. 3.1.17)

**Lemme**

\[ \int_0^{\infty} \frac{1}{\sqrt{t + \sqrt{1 + t}}} dt = \sqrt{\lambda} \left( 2 \lambda - 1 \right) B \left( 2 \lambda, \frac{1}{2} - \lambda - \mu \right) \]

with \( Re(\lambda) > 0, Re(\lambda + \mu) < \frac{1}{2} \)

4. Main integral

Let \( X = [\sqrt{x} + \sqrt{1 + x}]^2 \)

We have the following formula

**Theorem**

\[ \int_0^{\infty} \frac{x^{\lambda-1}}{\sqrt{1 + x}} X^\mu R_n^{\alpha, \beta} \left[ x^a X^b ; E, F, g, h, p, q ; \gamma, \delta ; e^{-g(x^a X^b)} \right] S_{N_1, \ldots, N_r}^{\delta_1, \ldots, \delta_r} \left( y_1 x^{e_1} X^{\mu_1} \right) \ldots \left( y_r x^{e_r} X^{\mu_r} \right) \]

\[ N_{\alpha; \beta}^{\lambda; \mu} \left( z_1 x^{g_1} X^{\delta_1} \ldots Z_s x^{g_r} X^{\delta_r} \right) \]

\[ \sum_{w, v, u, t, e, k1, k2} \sum_{G_1, \ldots, G_r} \sum_{\overrightarrow{g1} = 0}^{m_1} \sum_{\overrightarrow{g2} = 0}^{m_r} \ldots \sum_{\overrightarrow{g_r} = 0}^{m_r} \]

\[ \sum_{K_1 = 0}^{[N_1/M_1]} \ldots \sum_{K_r = 0}^{[N_r/M_r]} a_1 \psi(w, v, u, t, e, k1, k2) \]

ISSN: 2231-5373  http://www.iijmttjournal.org  Page 157
where

\[
G(\eta_{G_1, g_1}, \cdots, \eta_{G_r, g_r}) 2^{-2(\lambda - R a + \sum_{i=1}^{t} K_i \zeta_i + \sum_{i=1}^{r} \eta_{\alpha_i, \gamma_i} \alpha_i)} N^{0, N+2; V} \left( \begin{array}{c}
2^{-2\epsilon_s} Z_s \\
\cdots \\
2^{-2\epsilon_s} Z_s \\
\cdots
\end{array} \right)
\]

\[
\left( \frac{1}{2} + \mu + R(b + a) + \sum_{i=1}^{t} K_i (\mu_i + \zeta_i) + \sum_{i=1}^{r} \eta_{G_i, g_i} (\beta + \alpha_i); -\epsilon_1 - \eta_1, \cdots, -\epsilon_s - \eta_s, \right)
\]

(4.1)

\[
\begin{aligned}
& (1 - 2(\lambda + R a + \sum_{i=1}^{t} K_i \zeta_i - \sum_{i=1}^{r} \eta_{G_i, g_i} \alpha_i); 2\epsilon_1, \cdots, 2\epsilon_s), A : C \\
& (\frac{1}{2} + \mu + R(b - a) + \sum_{i=1}^{t} K_i (\mu_i - \zeta_i) + \sum_{i=1}^{r} \eta_{G_i, g_i} (\beta - \alpha_i); \epsilon_1 - \eta_1, \cdots, \epsilon_s - \eta_s), B : D
\end{aligned}
\]

where \( U_{21} = P_i + 2; Q_i + 1; t_i, r_i \)

Provided that

a) \( \min \{a, b, \zeta, \mu_i, \alpha_j, \beta_j, \epsilon_k, \eta_k, \} > 0, i = 1, \cdots, t_i, j = 1, \cdots, r_i, k = 1, \cdots, s, \)

b) \( Re(\lambda) > 0 \) and

c) \( Re(\lambda + \mu + R(a + b)) + \sum_{i=1}^{r} (\alpha_i + \beta_i) \min_{1 \leq j \leq m_i} Re \left( \frac{d_j^{(i)}}{\delta_j^{(i)}} \right) + \sum_{i=1}^{s} (\epsilon_i + \eta_i) \min_{1 \leq j \leq M_i} Re \left( \frac{\delta_j^{(i)}}{\beta_j^{(i)}} \right) < \frac{1}{2} \)

d) \( |arg z_k| < \frac{1}{2} A^{(k)}_i \pi, \) where \( A^{(k)}_i \) is defined by (1.5); \( i = 1, \cdots, r \)

e) \( |arg Z_k| < \frac{1}{2} B^{(k)}_i \pi, \) where \( B^{(k)}_i \) is defined by (1.13); \( i = 1, \cdots, s \)

**Proof**

Expressing the general sequence of functions \( R^{\alpha, \beta}_{\eta_i} \left[ x^a X^b; E, F, g, h; p, q; \gamma; \delta, e^{-s(x^a X^b)^r} \right] \) in multiple series with the help of equation (2.1), the Aleph-function of \( r \) variables in series with the help of equation (1.6), the general class of polynomial of several variables \( S^{M_1, \cdots, M_s} \) with the help of equation (1.22) and the Aleph-function of \( s \) variables in Mellin-Barnes contour integral with the help of equation (1.9), changing the order of integration ans summation (which is easily seen to be justified due to the absolute convergence of the integral and the summations involved in the process) and then evaluating the resulting integral with the help of equation (2.1). Finally interpreting the result thus obtained with the Mellin-barnes contour integral, we arrive at the desired result.

5. Multivariable I-function

If \( \epsilon_i, t_i, \cdots, t_i \rightarrow 1 \), the Aleph-function of several variables degenerates to the I-function of several variables. The simple integral have been derived in this section for multivariable I-functions defined by Sharma et al [6].

**Corollary 1**
\[
\int_0^{\infty} \frac{x^{\lambda-1}}{\sqrt{1 + x}} X^\mu R_n^{\alpha,\beta} \left[ x^a X^b; E, F, g, h; p, q; \gamma; \delta; e^{-g(x^a X^b)^r} \right] S_M^{N_1, \ldots, N_t} \left( \frac{y_1 x^{\xi_1} X^{\mu_1}}{y_1 x^{\xi_1} X^{\mu_t}} \right)
\]

\[
\sum_{K_1=0}^{[N_1/M_1]} \cdots \sum_{K_t=0}^{[N_t/M_t]} \alpha_1 \psi(w, v, u, t, e, k_1, k_2) \left( \frac{(-1)^{G_1+\cdots+G_r}}{\delta_G G_1! \cdots \delta_G G_r} \right)^{G_1 \cdots G_r} \left( \frac{y_{1,2,1}^{\eta_1,1} \cdots y_{1,2,1}^{\eta_r,r}}{2^{-2\epsilon_1} Z_1} \right)
\]

\[
G(\eta_{G_1, G_1}, \ldots, \eta_{G_r, G_r}) 2^{-2(\lambda - Ra + \sum_{i=1}^t K_i \zeta_i + \sum_{i=1}^r \eta_{G_i, G_i})} \int_0^{N+2:V} \left( \frac{2^{-2\epsilon_1} Z_1}{2^{-2\epsilon_2} Z_2} \right)
\]

\[
(\frac{1}{2} + \mu + R(b + a) + \sum_{i=1}^t K_i (\mu_i + \zeta_i) + \sum_{i=1}^r \eta_{G_i, G_i} (\beta + \alpha_i) - c_1 - \eta_1, \ldots, -c_s - \eta_s), \quad \ldots
\]

\[
\begin{pmatrix}
(1-2(\lambda + Ra + \sum_{i=1}^t K_i \zeta_i - \sum_{i=1}^r \eta_{G_i, G_i} \alpha_i); 2\epsilon_1, \cdots, 2\epsilon_s), A : C \\
(\frac{1}{2} + \mu + R(b - a) + \sum_{i=1}^t K_i (\mu_i - \zeta_i) + \sum_{i=1}^r \eta_{G_i, G_i} (\beta - \alpha_i); \epsilon_1 - \eta_1, \cdots, \epsilon_s - \eta_s), B : D
\end{pmatrix}
\]

(5.1)

under the same conditions and notations that (4.1) with \( \ell_i, \ell_i^{(1)}, \cdots, \ell_i^{(s)} \to 1 \)

6. Aleph-function of two variables

If \( s = 2 \), we obtain the Aleph-function of two variables defined by K.Sharma [8], and we have the following simple integrals.

Corollary 2

\[
\int_0^{\infty} \frac{x^{\lambda-1}}{\sqrt{1 + x}} X^\mu R_n^{\alpha,\beta} \left[ x^a X^b; E, F, g, h; p, q; \gamma; \delta; e^{-g(x^a X^b)^r} \right] S_M^{N_1, \ldots, N_t} \left( \frac{y_1 x^{\xi_1} X^{\mu_1}}{y_1 x^{\xi_1} X^{\mu_t}} \right)
\]

\[
\sum_{K_1=0}^{N_1, \ldots, N_t} \sum_{K_t=0}^{N_0, N_V} \sum_{K_r=0}^{N_{U,W}} \sum_{K_s=0}^{N_{U,W}} \left( \frac{Z_1 x^{\xi_1} X^{\mu_1}}{Z_2 x^{\xi_2} X^{\mu_2}} \right) dx = 2
\]

ISSN: 2231-5373  http://www.ijmttjournal.org  Page 159
under the same conditions and notation that (4.1) with $s = 2$

7. I-function of two variables

If $\kappa, \kappa', \tau, \kappa'' \to 1$, then the Aleph-function of two variables degenerates in the I-function of two variables defined by Sharma et al [7] and we obtain the same formula with the I-function of two variables.

Corollary 3

\[
\int_0^\infty \frac{x^{\lambda-1}}{\sqrt{1 + x}} X^\mu R_n^{\alpha, \beta} \left[ x^\alpha X^b, E, F, g, h, p, q; \gamma, \delta; e^{-s(x^a X^b)^r} \right] S_{N_1, \ldots, N_t} y_{1} x^{\xi_1} X^{\mu_1} \ldots y_{t} x^{\xi_t} X^{\mu_t} dx = 2 \sum_{w, v, u, t, e, k_1, k_2} \sum_{G_1, \ldots, G_t=0}^{\infty} \sum_{m_1=0}^{\infty} \sum_{m_2=0}^{\infty} \sum_{g_0=0}^{\infty} \sum_{g_r=0}^{\infty} \sum_{\omega=0}^{\infty}
\]

\[
G(\eta_{G_1, g_1}, \ldots, \eta_{G_t, g_t}) 2^{-2(\lambda - R\alpha + \sum_{i=1}^t K_i \zeta_i + \sum_{i=1}^t \eta_{G_i, g_i}; \epsilon_1, \epsilon_2, \eta_1, \eta_2)} \frac{\left( - \right)^{G_1 + \ldots + G_t}}{\delta_{g_1} G_1! \ldots \delta_{g_r} G_r!} y_{1}^K \ldots y_{t}^K z_{1}^{\eta_{G_1, g_1}, \ldots, \eta_{G_t, g_t}} 2^{\frac{2-2\epsilon_1}{Z_1}} \ldots 2^{\frac{2-2\epsilon_2}{Z_2}}
\]
\[
\left( \frac{1}{2} + \mu + R(b + a) + \sum_{i=1}^{t} K_i(\mu_i + \zeta_i) + \sum_{i=1}^{r} \eta G_{i,gi}(\beta + \alpha_i); -\epsilon_1 - \eta_1, -\epsilon_2 - \eta_2), \quad \ldots \right.
\]

\[
\left( 1 - 2(\lambda + Ra + \sum_{i=1}^{t} K_i \zeta_i - \sum_{i=1}^{r} \eta G_{i,gi} \alpha_i); 2\epsilon_1, 2\epsilon_2), A : C \right. \\
\left. \frac{1}{2} + \mu + R(b - a) + \sum_{i=1}^{t} K_i(\mu_i - \zeta_i) + \sum_{i=1}^{r} \eta G_{i,gi}(\beta - \alpha_i); \epsilon_1 - \eta_1, \epsilon_2 - \eta_2), B : D \right)
\]

under the same conditions and notation that (4.1) with \( s = 2 \) and \( t_i, t_i', t_i'' \to 1 \).

8. Conclusion

In this paper we have evaluated an integral involving the multivariable Aleph-functions, a class of polynomials of several variables and the general of sequence of functions. The integral established in this paper is of very general nature as it contains Multivariable Aleph-function, which is a general function of several variables studied so far. Thus, the integral established in this research work would serve as a key formula from which, upon specializing the parameters, as many as desired results involving the special functions of one and several variables can be obtained.
